

a Object and baseline

Question: which constraints move null thresholds toward roads?

b

Formal null ladder 8 method-coherent cities

c

Full-city geometry screen 71 standardized windows

Allowed claim: a model-conditional null ladder separates degree, edge-scale and strict embedded-geometry baselines.
The full-city low-intensity layer tests coverage; the higher-intensity subset tests sensitivity.
Forbidden overclaim: not a universal planar theorem, causal urban-design rule or high-intensity all-city planar null.

Evidence domains are separated: full-city low-intensity coverage is not a planar-percolation proof.
